To begin with I would say one to one correspondents between labels and hilights?

What happens if I select some text that is already hilighted? can I hilight the same section of tex twice and give it different labels? if so how do we display this from a UXa perspective?

Create a new label

1 List of labels for the project should be visible when annotating a project. To reduce cognitive load of trying to remember what they are when annotating text.

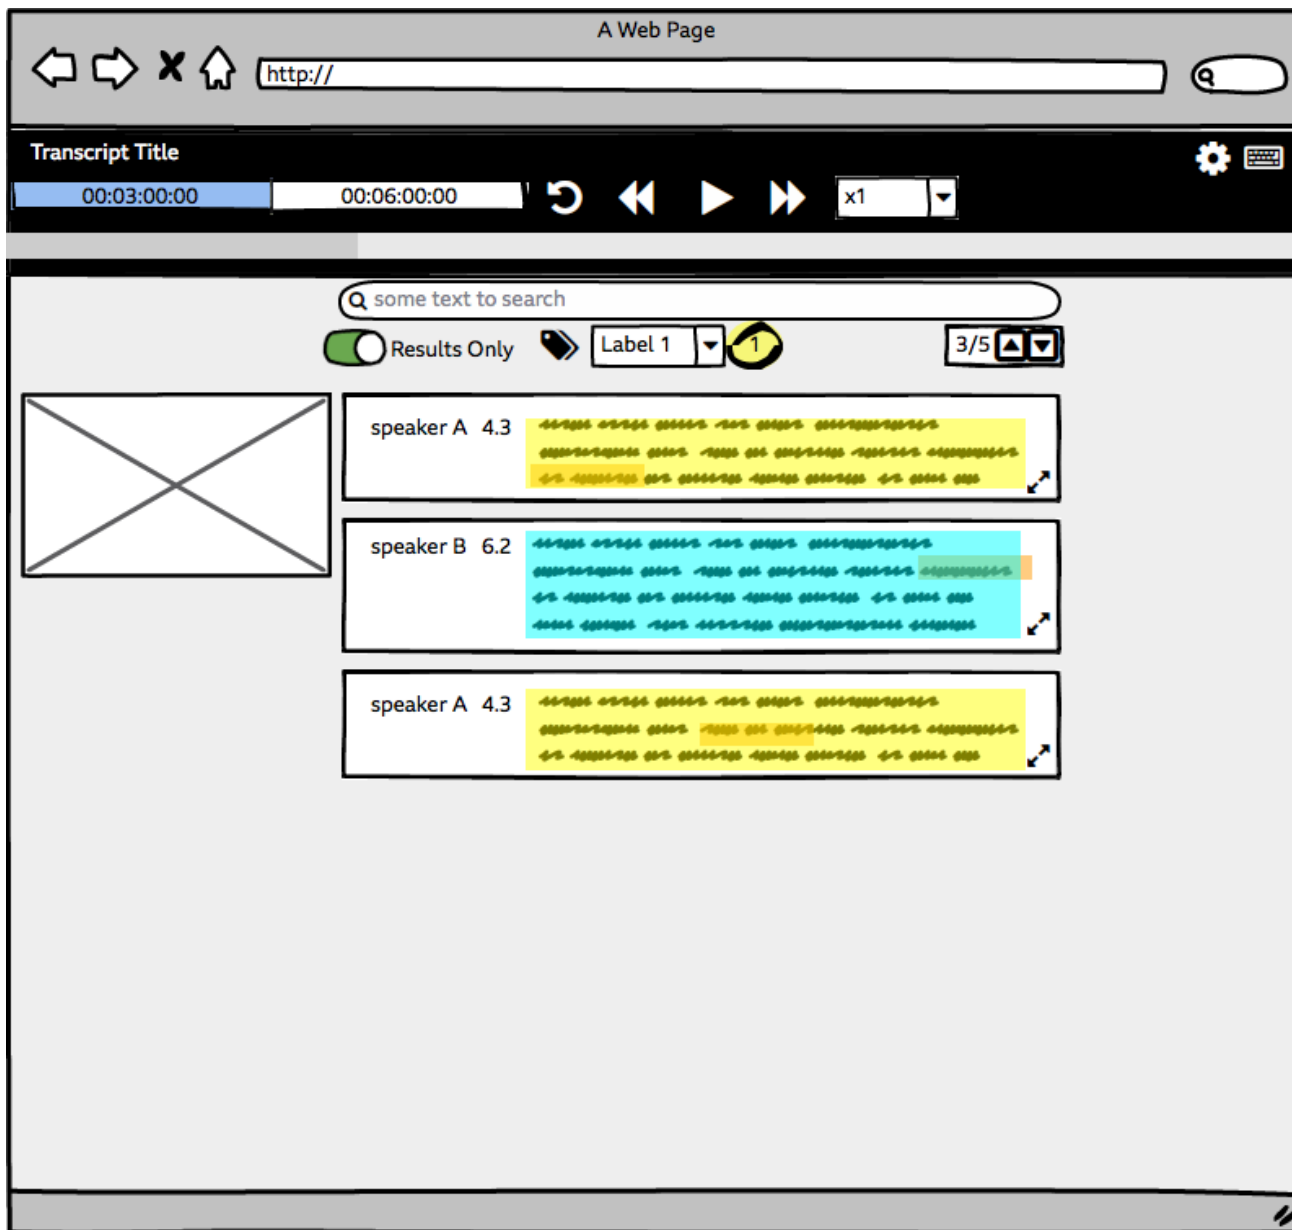

Consider having a separate page to list/edit labels? (similar to github labels)

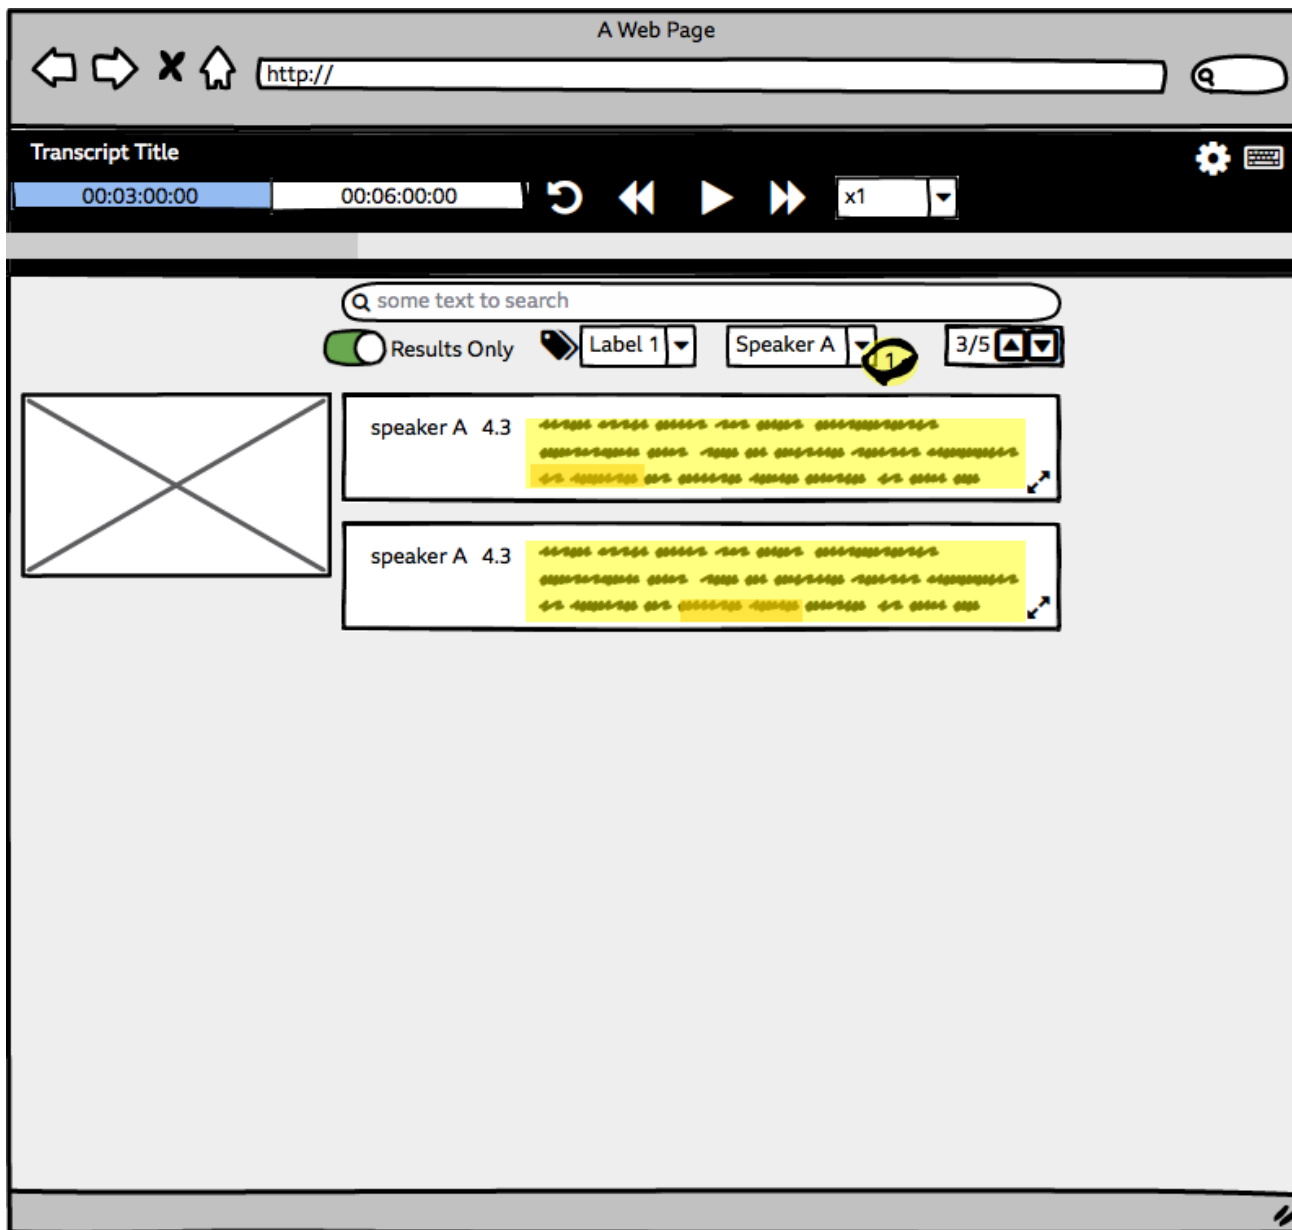

1 "results only" to show, the words, or phrases searched in the context of the paragraph they belong to

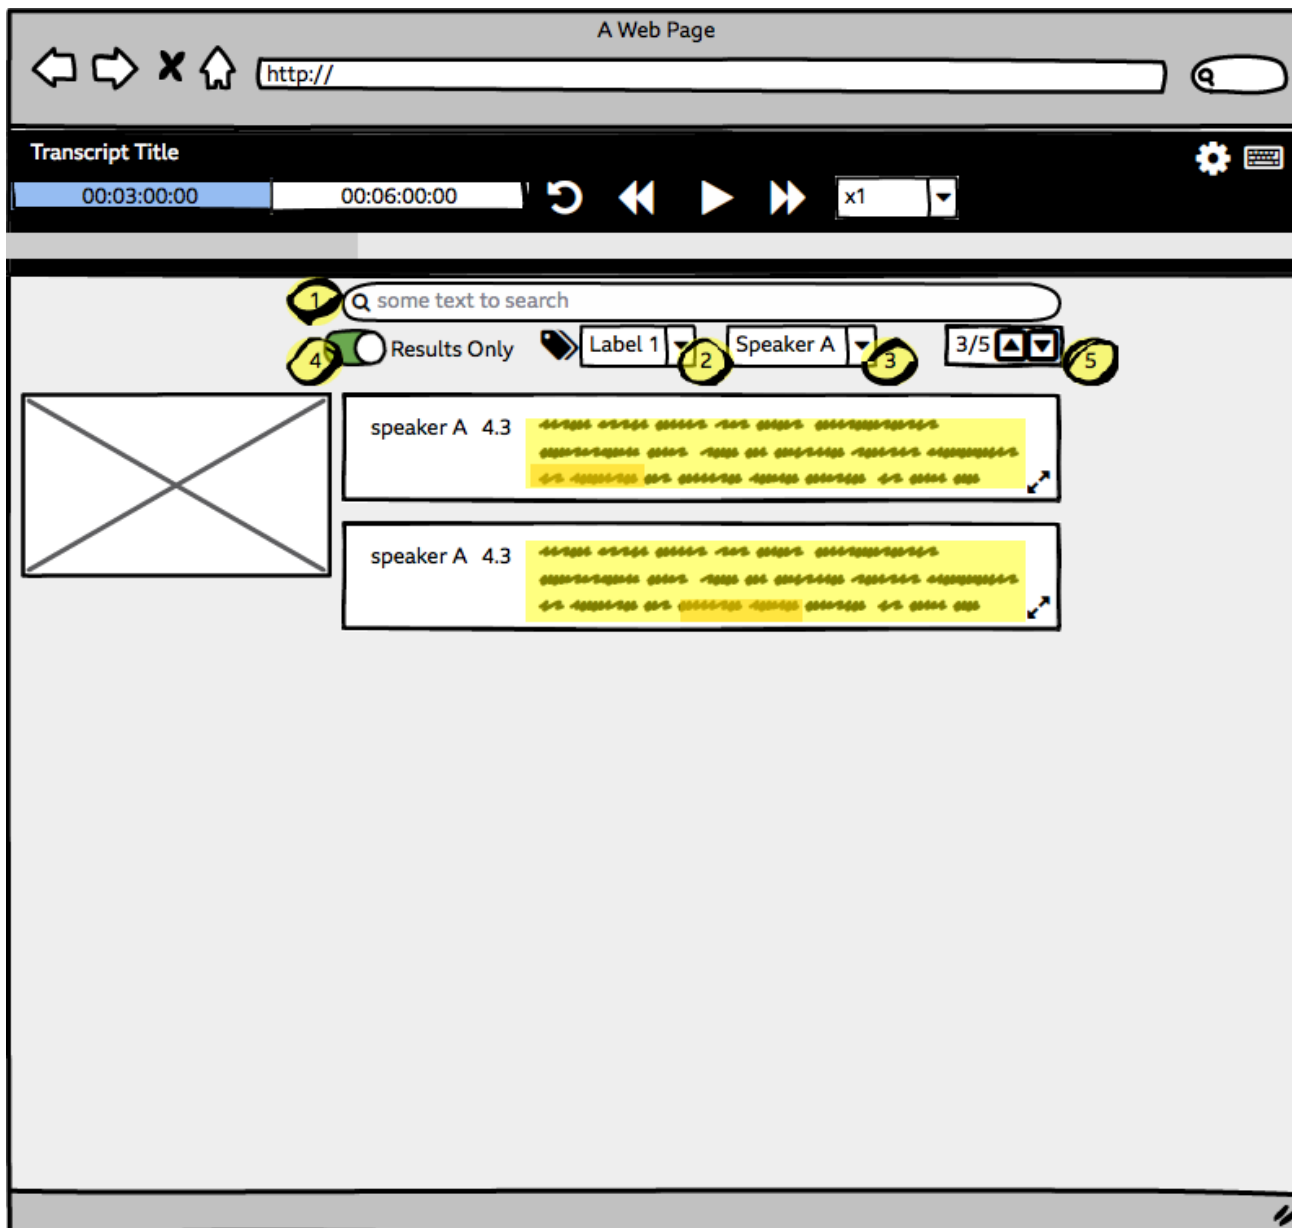

2 ↗ to open this search result in the context of the main transcript - might be easier to open in a new window(?)

1 Filter transcript text by labels. And/or filter search results by labels.

1 Filter transcript text by Speaker. And/or filter search results by speaker label.

Recap of Search/Filter Features:

Search

- By text: words or sentences

Filter:

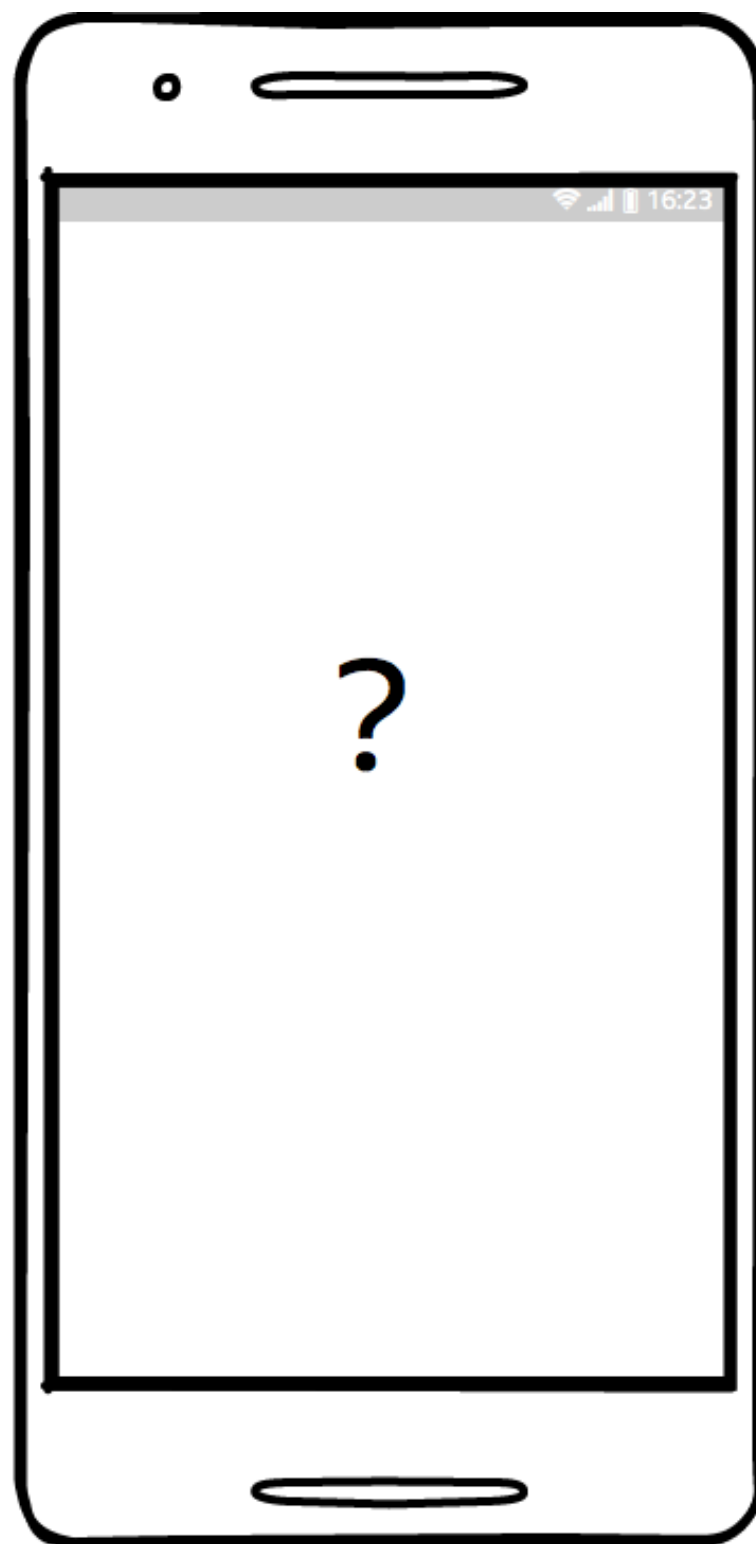

- Filter transcript text by Labels. And/or filter search results by labels.
- Filter transcript text by Speaker. And/or filter search results by speaker label.

combine search + filters

Option to see results in context or only paragraph containing matched criterias for search and filter

option to move between results. and see number of matches

option to hilight and tag/label text from search results.

- 1 Story outline - bullet points
- 2 Voice over text.
Could be previewed as TTS Or even better, could be previewd as titles text on screen. with estimated count of time duration based on word count etc..
- 3 Insert point.
Marks where the paper cut will be added to the paper-edit as alternative to drag and drop between transcript and paper-edit.
It defaults to the end of the paper-edit but can be changed by clicking on another paper cut element in the paper-edit
- 4 Can drag to rearrange order of outline section
- 5 + Add paper-cut

- 1 Paper-edit
- 2 Paper-cut
- 3 Same component, as the Transcript annotation one, but can search across all of the transcripts in the project.

4 bullet point titles could be hidden and just used for structure, or could have option to show as actual title on screen for video? ignored for radio?

Or there could be a separate element, similar to Voice over, but for on screen titles, for video only

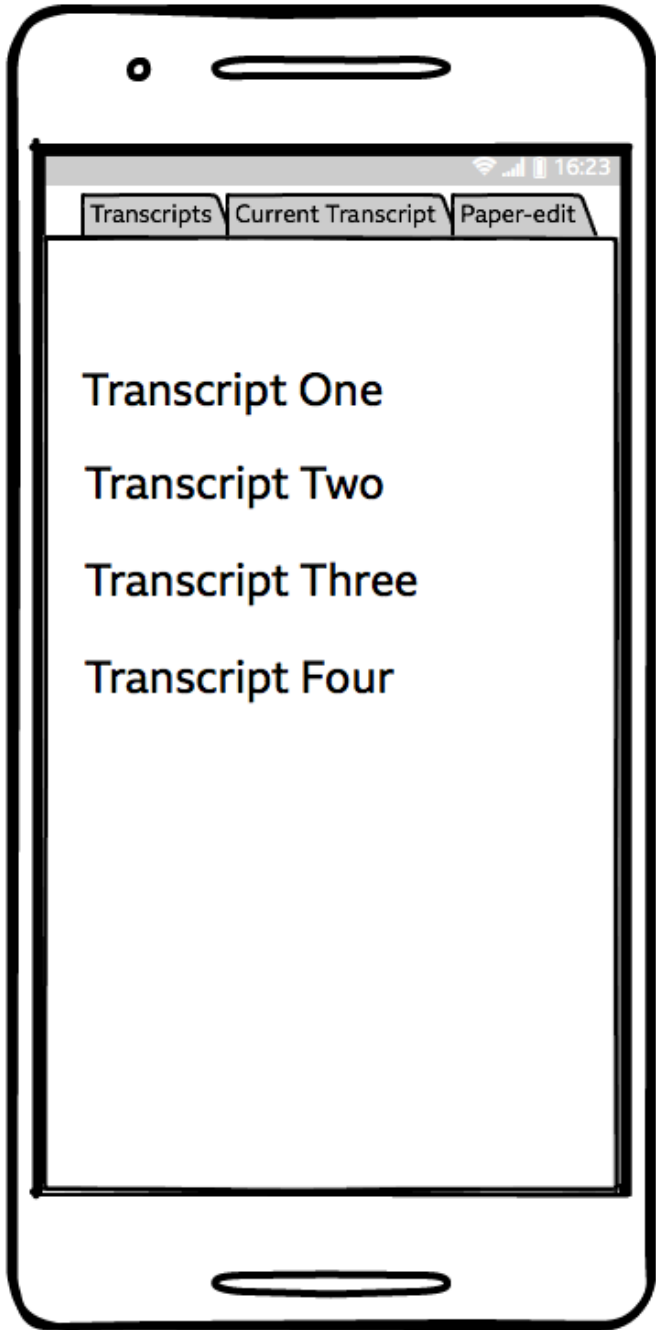

3 There should be extra filter to narrow down search/filter in current transcript or across 1, more or all of the transcript in the project.

4 could also minimise content, and just see outline topline/title. Filter view of paper-edit, and only see one speaker, or voiceover, or title, etc..

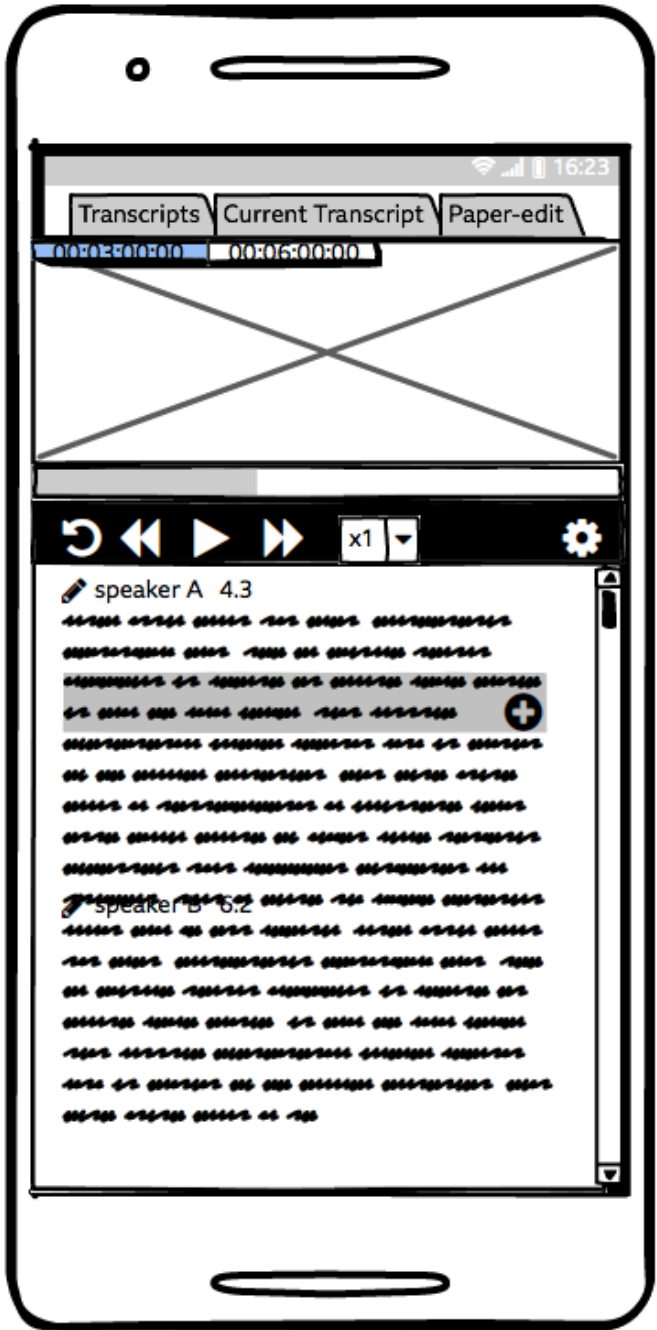

5 When done with selection could either automatically copy paper-cut to paper-edit. see point 3.

Or it could add a + to have one more step to confirm adding to paper-edit?

speaker B Transcript 2

2 To show where paper cut in paper edit comes from in original transcript transcript should this happen

- open in new window?
- or on the left section?

3 Good way to do this still up for grab

- 1 Paper cut in paper-edit should have a reference to know which transcript it original belongs to
- 2 Paper cut in paper-edit should have a way to show in context where it was taken from in the original transcript
- 3 Paper cut in paper-edit should have a way to show if it has been labeled/tagged in original transcript
- 4 Adding a paper-cut withing a annotation hilight. Annotation hilight is light blue coloru for the block. and the shaded part of the text, is a user text selection equivalent to a paper-cut
